

Standard Operating Procedure

How to use the Master Data Validator for SAP S/4HANA LTMC pre-upload validation.

Purpose

The Master Data Validator (MDV) is a web-based tool that validates SAP Legacy Transfer Migration Cockpit (LTMC) source templates before they are loaded into S/4HANA. It transforms thousands of cell-level errors into a small set of business decisions, lets Subject Matter Experts (SMEs) fix data inline, maintains a complete audit trail, and produces a bit-perfect LTMC-ready XML file for upload.

This document describes the standard procedure for all roles: module SMEs, IT users, and administrators. Follow the steps in order for each workflow.

Roles and Access

Administrator	Manages users, views the global audit trail, has access to all modules and all files.
IT User	Read-only access to files across all modules. Can mark files as LTMC Uploaded once validated.
Module SME (SD/MM/PP/QM/FICO)	Uploads, edits, and validates files for their assigned module only. Cannot access other modules' files.

Standard Workflow

The validation workflow has four stages: Upload, Resolve, Validate, LTMC Upload. A file progresses through these statuses one direction; revocation is possible at any step.

In Progress	File is uploaded; one or more errors are pending resolution. Module SME is responsible.
Validated	All errors resolved. Module SME has signed off. Visible to IT and admin for LTMC upload.
LTMC Uploaded	IT or admin has loaded the file into the live LTMC project. Terminal status — file is locked.

Stage 1 — Upload

Role: Module SME

Goal: Get the LTMC source file into the repository and validated.

- Log in with your module credentials (for example, **sduser** for Sales & Distribution).
- On the Repository screen, click **Upload File**.
- Select the module (only your module is available).
- Drag the SAP-provided XML or XLSX template into the drop zone, or click **Choose file**.
- Watch the progress bar: upload, then parse, then validation.
- Once complete, the file opens automatically in the Dashboard view.

Files over 100 MB trigger a warning. The current tool handles files up to several hundred MB comfortably. Streaming support for multi-gigabyte files is on the roadmap.

Stage 2 — Resolve Errors

Role: Module SME

Goal: Reduce Pending Errors to zero using decisions and inline edits.

Option A — Bulk decisions (recommended first)

- Open the **Decisions** view.
- Read each decision card. A Pattern decision groups many rows that share the same invalid value.
- Click **Preview affected rows** to verify what will change before committing.
- Click an action: **Replace with**, **Fill with**, **Truncate**, **Clear**, or for duplicates **Delete duplicate rows**.
- Enter a business reason — this is required for every bulk change and is stored in the audit trail.
- Apply. The decision is resolved; errors drop accordingly.

Option B — Individual record editing

- Open the **Error Grid** or click a specific row from the Preview modal.
- In the Record Editor, issues are pinned at the top in a red-bordered banner.
- Fix the values directly inline. Click **Save**.
- Use **J / K** keys (or the Prev/Next Error buttons) to jump between error records.
- To delete a row entirely, click **Delete row** and provide a reason.

Handling duplicate customers

- In the Preview modal, duplicate clusters are shown side-by-side.
- Each row shows key fields (Name, City, PAN, GSTIN) plus Sales Areas (Sales Org / Distribution Channel / Division).
- A Completeness score indicates which row has more non-blank fields.
- Select rows with checkboxes; use **Select all DUP** to pick every flagged duplicate.
- Click **Delete selected** and enter a reason.

Stage 3 — Mark as Validated

Role: Module SME

The **Mark as Validated** button is visible only when *all errors are resolved*. It appears in three places: the Dashboard header, the Export page, and the Repository row actions.

- Confirm that Pending Errors shows **0** and Completion shows **100%**.
- Click **Mark as Validated**. Confirm the action.
- The file's status changes from In Progress to Validated.
- Your name and the timestamp are recorded and visible to everyone.

Stage 4 — LTMC Upload

Role: IT User or Administrator

- Log in as **ituser** (or admin).
- In the Repository, filter by status **Validated** to find files ready for LTMC.
- Click **Download** on the file row (or open the file and use the Export page).
- Load the downloaded XML into SAP LTMC using the standard LTMC migration project.
- Once LTMC confirms the load succeeded, return to the tool and click **Mark LTMC Uploaded**.
- The file enters its terminal state; this is recorded in the audit trail.

Revocation

If an issue is discovered after marking a file as Validated, the original validator (or any administrator) can click **Revoke** to return the file to In Progress. This is also logged in the audit trail.

Exporting the LTMC-Ready File

The Export page produces a bit-perfect SAP LTMC XML file that matches the original template structure, including namespaces, cell styles, and LTMC metadata.

- Navigate to **Export** from the sidebar.
- Review the summary: number of records, decisions applied, sheets included.
- The confirmation line confirms: Namespaces preserved · LTMC metadata kept · Cell styles intact.
- If any decisions are still pending, a warning appears. You can export anyway or go back to resolve.
- Click **Download LTMC XML**. The file saves as *originalname_clean.xml*.

Audit Trail

Every action is logged to a persistent audit trail stored in the Postgres database. The log entry includes: timestamp, user, role, action, affected file, sheet, module, row count, and the business reason provided.

The Dashboard's **Recent Activity** panel shows the history for the currently-open file. This persists across sessions and users — if another SME opens the same file tomorrow, they see everything you did today.

The Administrator has a dedicated **Audit Trail** view that shows every action across every file, with filters for action type, user, and free-text search.

Undo: Bulk and row-level changes made during the current session can be undone via the Recent Activity panel. Once you switch files or log out, the ability to undo is released — the change stays but cannot be reverted with one click.

Troubleshooting

Cannot log in	Confirm your password with your administrator. If you are the administrator and have lost your password, see the README for a SQL-based reset procedure.
Upload fails	Check the file extension (.xml or .xlsx only) and that the file is from the SAP LTMC source template.
Mark as Validated button missing	The button only appears when Pending Errors is 0. Resolve the remaining decisions first.
Another user's validation blocks my work	Only the original validator or an administrator can revoke. Contact either to unlock the file.
File not visible in my Repository	Module SMEs only see their own module's files. Ask your administrator to check the file's module assignment.

Support

For questions about this tool, contact your project lead or the administrator. For issues about data content (e.g., which PAN to use, which sales org is correct), consult your module's functional lead or data steward. The tool does not prescribe business rules — it enforces them as configured.
